

Professional Services Offerings - Basic

Initial Setup & Environment Configuration

Operating System (Linux)

- Install and configure Red Hat Enterprise Linux (RHEL).
- Integrate with existing infrastructure with a focus on compatibility and security.
- Deploy essential patches, updates, perform vulnerability scans, register with Red Hat Subscription Manager, and implement system hardening.
- Proficiency in installation workflows (both ISO and VM), use of package managers, and network configuration via CLI or system/networkd.

Docker & Container Platform Setup

- Install Docker engine and necessary components.
- Configure Docker containers, including crafting Dockerfiles, environment variables, volume management, and custom networking (bridge, host, overlay).
- Provide training covering Docker CLI commands ("run", "ps", "logs", etc.), image building, container lifecycle, and troubleshooting.

Networking Setup

- Assist in designing and deploying physical and software-defined network topologies.
- Configure switches, routers, and firewalls, with support for VLAN creation, trunk/access port configuration (802.1Q tagging), spanning tree, port mirroring, and diagnostics with SPAN.
- Set up network monitoring tools for performance insights.
- Proficiency in OSI models, subnetting, IP routing, VLAN traffic flow, and real-world troubleshooting with tools like Packet Tracer or GNS3.

Cloud Infrastructure Support

- Support basic Cloud setup: compute, storage, and virtual networking.
- Configure virtual networks, subnets, routing tables, security groups, and integrate Cloud with existing on-prem environments.
- Provide Cloud training focused on compute instance management, virtual network fundamentals, security best practices, and hybrid deployment patterns.

Customization & Workflow Integration

- Tailor OS configurations (e.g., access control, performance tuning, security policies) to client business needs.
- Customize Docker setups to match application stack demands—covering volumes, environment settings, inter-container networking.
- Optimize network configurations for specific workload patterns and performance requirements.
- Configure Cloud networking, compute, and storage for seamless integration with on-prem systems.
- Enable smooth integration with existing IT systems and workflows, leveraging scripting and automation to facilitate efficient, repeatable deployments.
